SIGNAL AND IMAGING SCIENCES WORKSHOP, CENTER FOR ADVANCED SIGNAL AND IMAGING
SCIENCES, LAWRENCE LIVERMORE NATIONAL LABORATORY, NOVEMBER 18-19, 2004

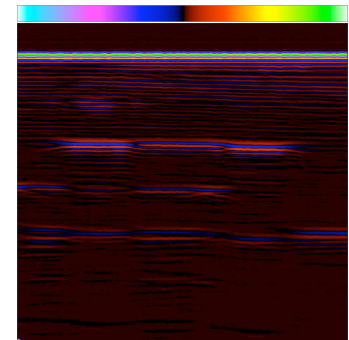

IMPULSE RESPONSE ESTIMATION FOR SPATIAL RESOLUTION ENHANCEMENT IN 3D ULTRASONIC NONDESTRUCTIVE EVALUATION IMAGERY

**GRACE A. CLARK (EE/EETD)
STEVEN E. BENSON (ME/MMED)**

NOVEMBER 19, 2004

THIS WORK WAS PERFORMED UNDER THE AUSPICES OF THE U.S. DEPARTMENT OF ENERGY BY THE UNIVERSITY OF
CALIFORNIA, LAWRENCE LIVERMORE NATIONAL LABORATORY UNDER CONTRACT No. W-7405-ENG-48.

Go Boilers!!!

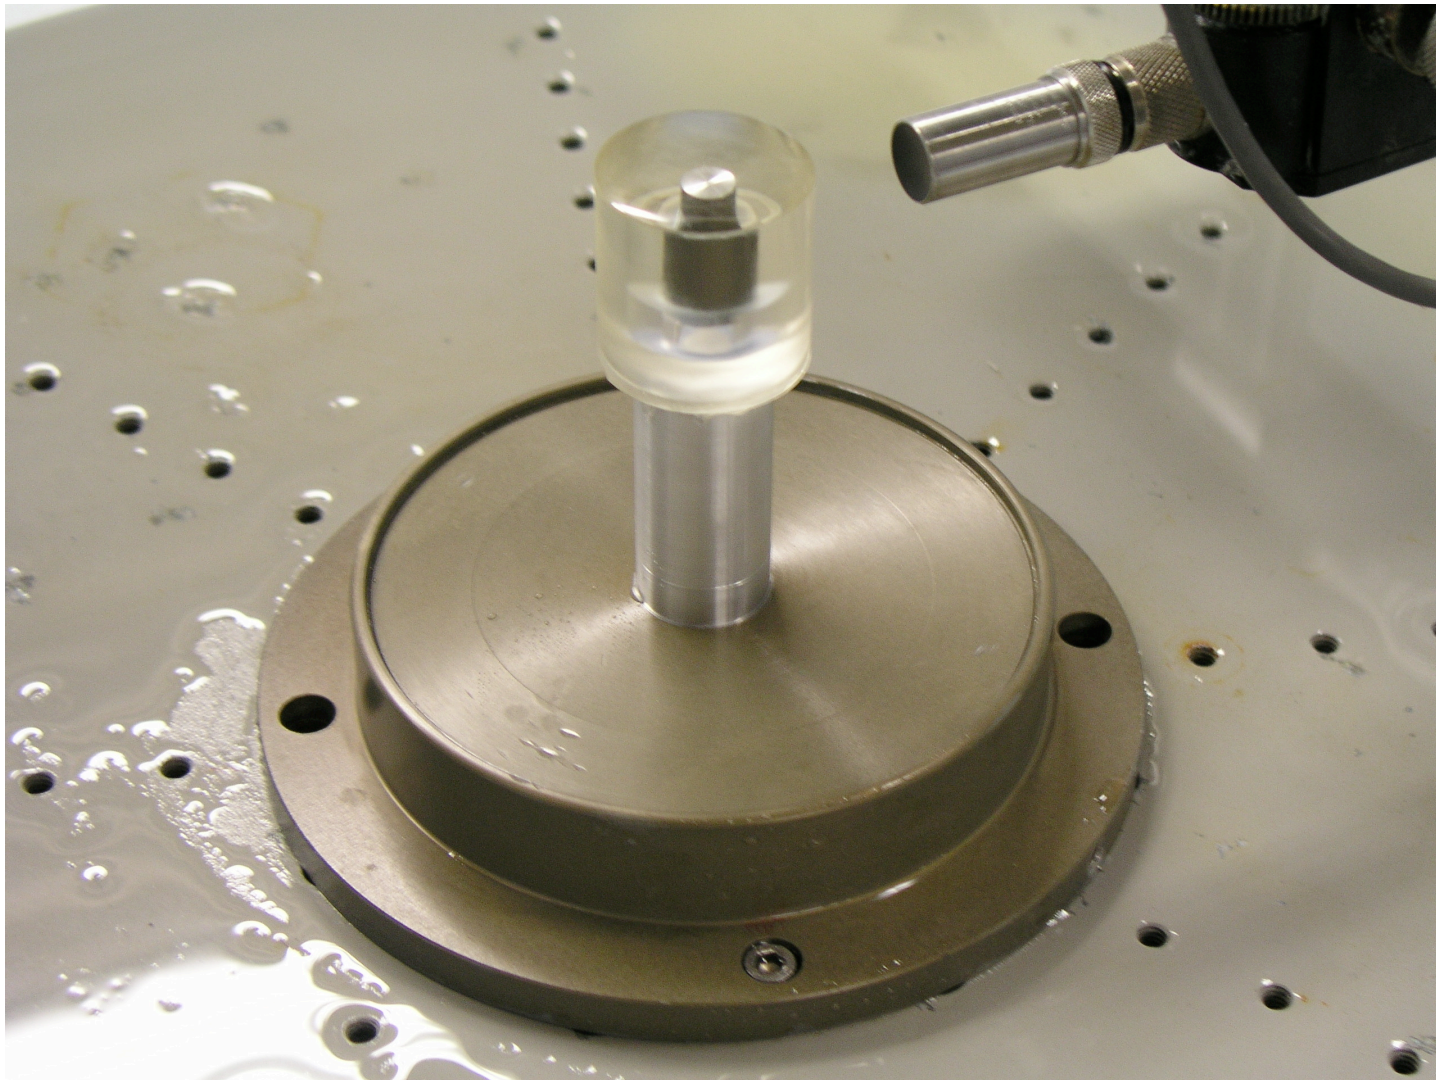

Purdue's "All-American" Marching Band

Agenda

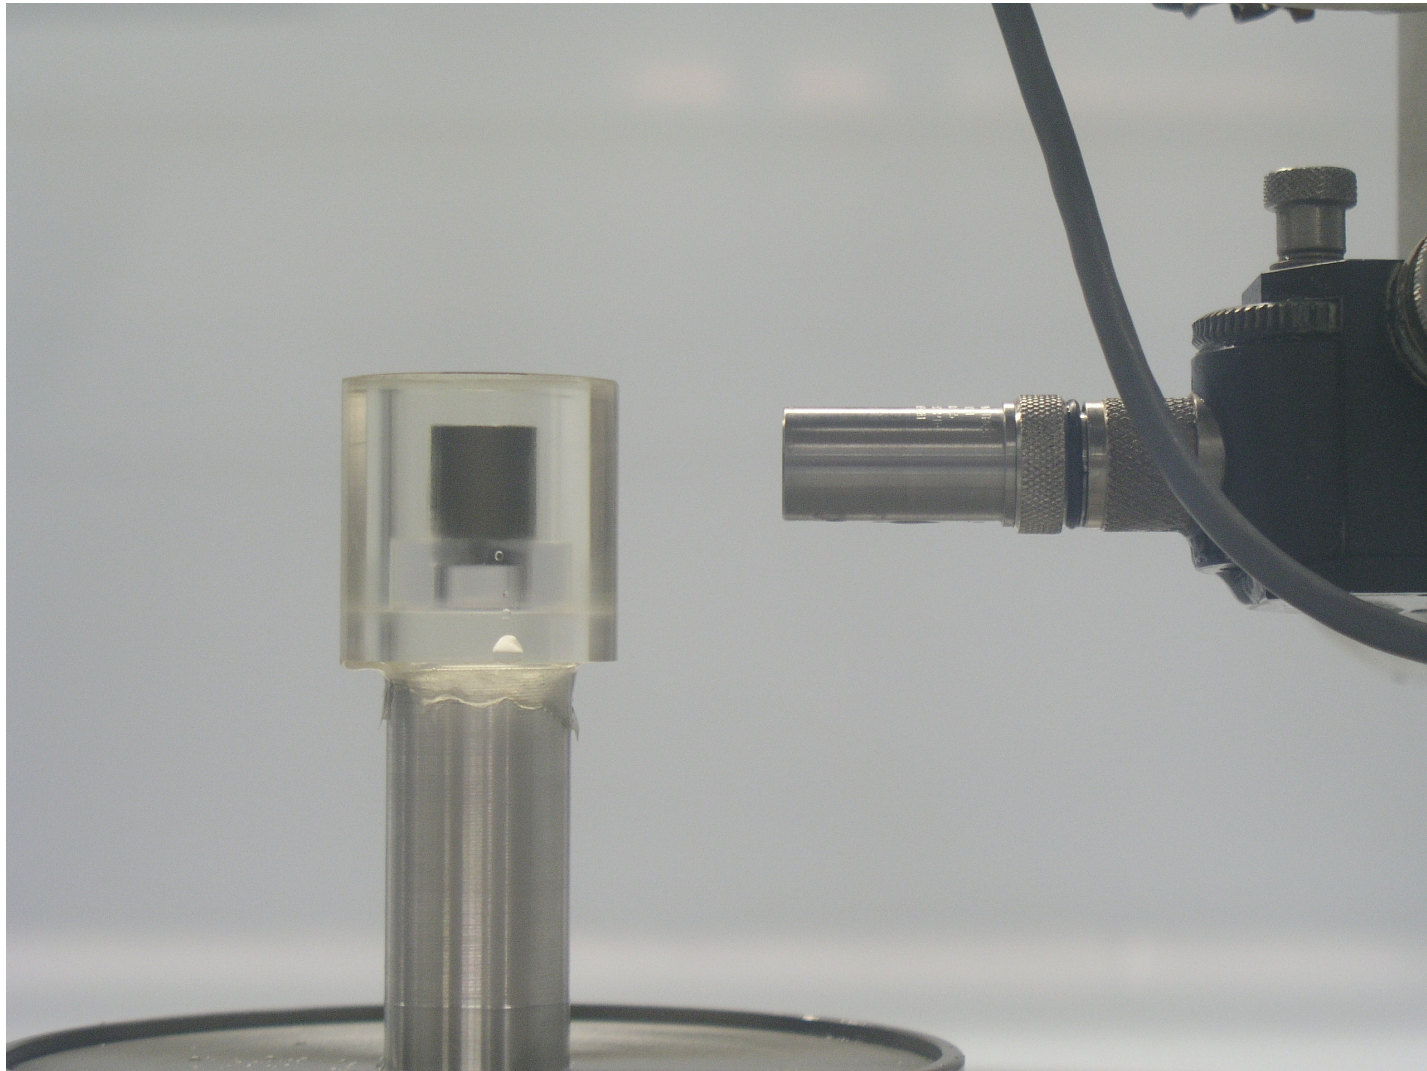

- **Problem Definition:**
 - Ultrasonic NDE measurements
 - The spatial resolution problem
- **Impulse Response Estimation for Enhancing Spatial Resolution**
 - Mitigate “ringing” due to the transducer and propagation paths
- **Workstation dedicated to processing and rendering 3D ultrasonic data sets**
- **Examples of Processing Results**

The “Phantom” Part is Placed on a Fixture And Rotated. The Transducer Position is Fixed

The Ultrasonic Transducer Position is Fixed As the “Phantom” Part is Rotated on the Fixture

ENG-03-0051-0 6
Clark-11/18/04, UCRL-PRES-208121

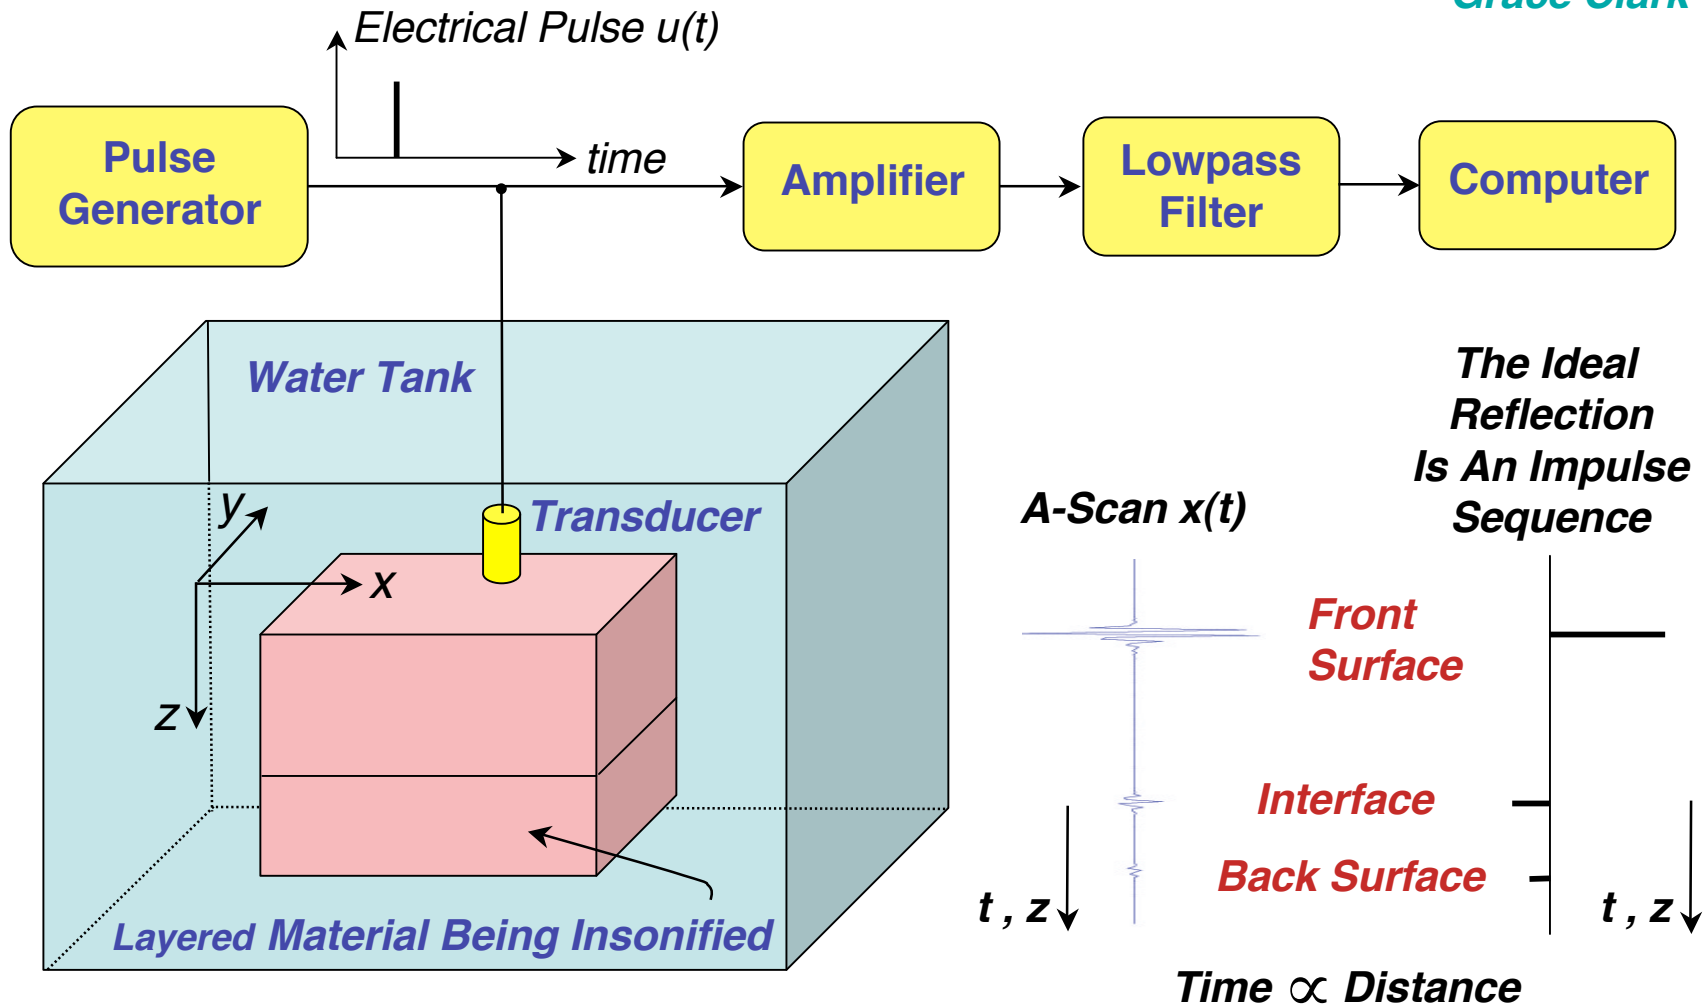

Grace A. Clark, Ph.D.

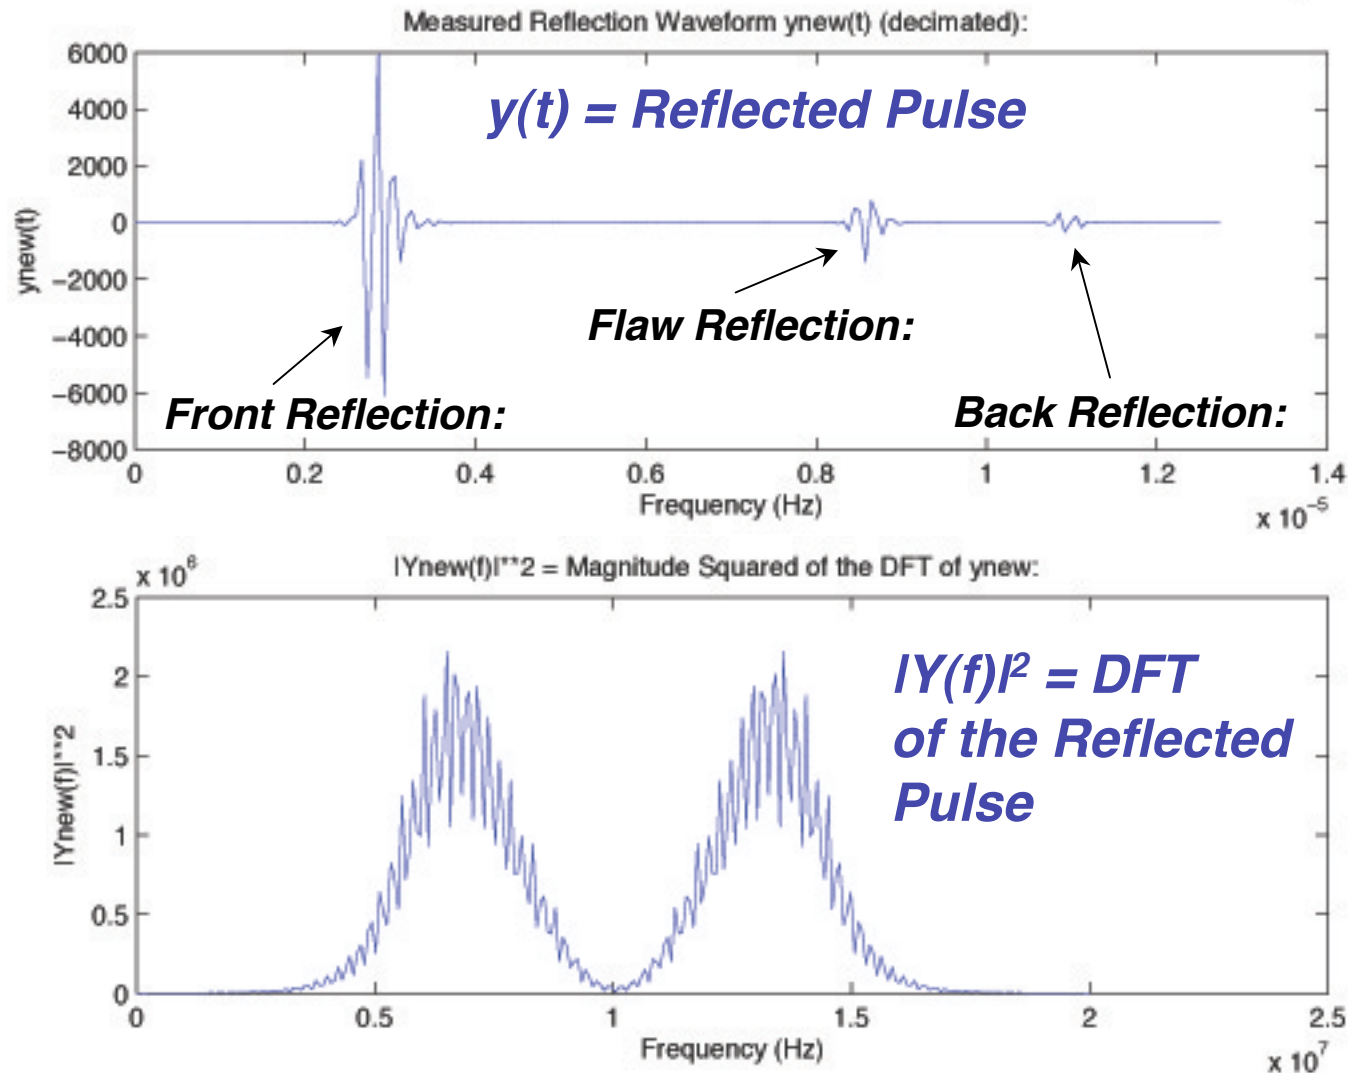

Ultrasonic Pulse-Echo Signals (*A-Scans*) Are *Distorted* By the *Transducer* and the *Propagation Paths* (“*Ringing*”)

Grace Clark

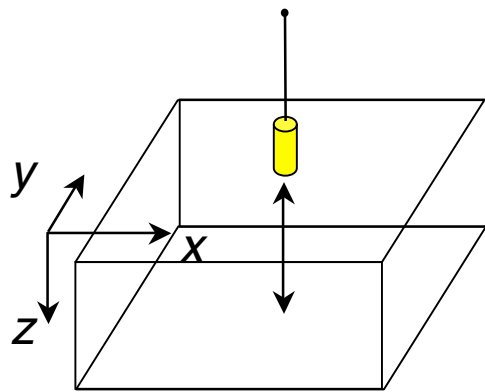

Ultrasonic Pulses Are **Bandlimited** by the Transducer ==> The Pulses **"Ring"**, Reducing Spatial Resolution

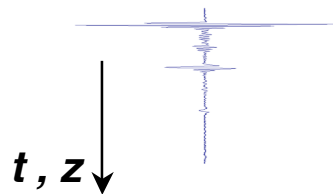

We Define Ultrasonic *A-, B-, and C-Scans* Used in Nondestructive Evaluation (NDE) Studies:

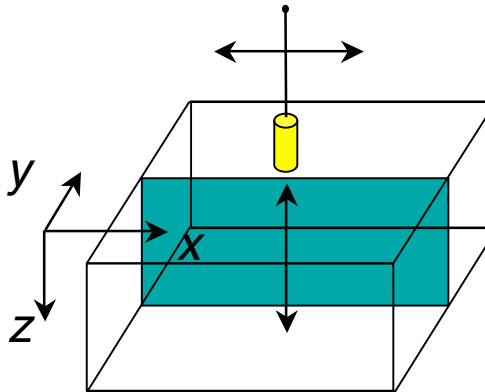

Grace Clark

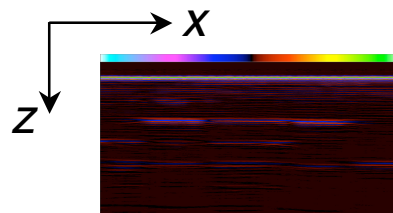

A-Scan $x(t)$
(A Single Waveform)

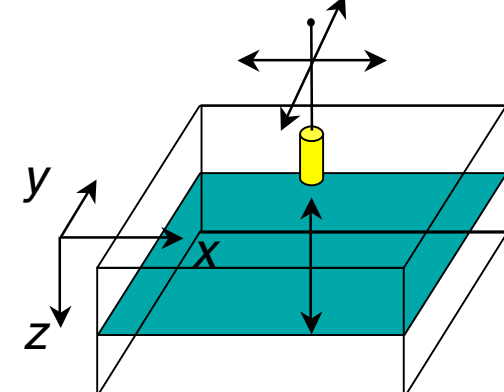

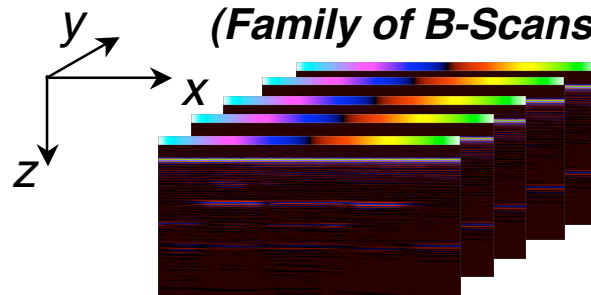

Time \propto Distance

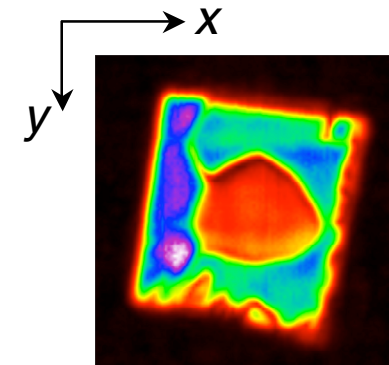

B-Scan
(Family of A-Scans)

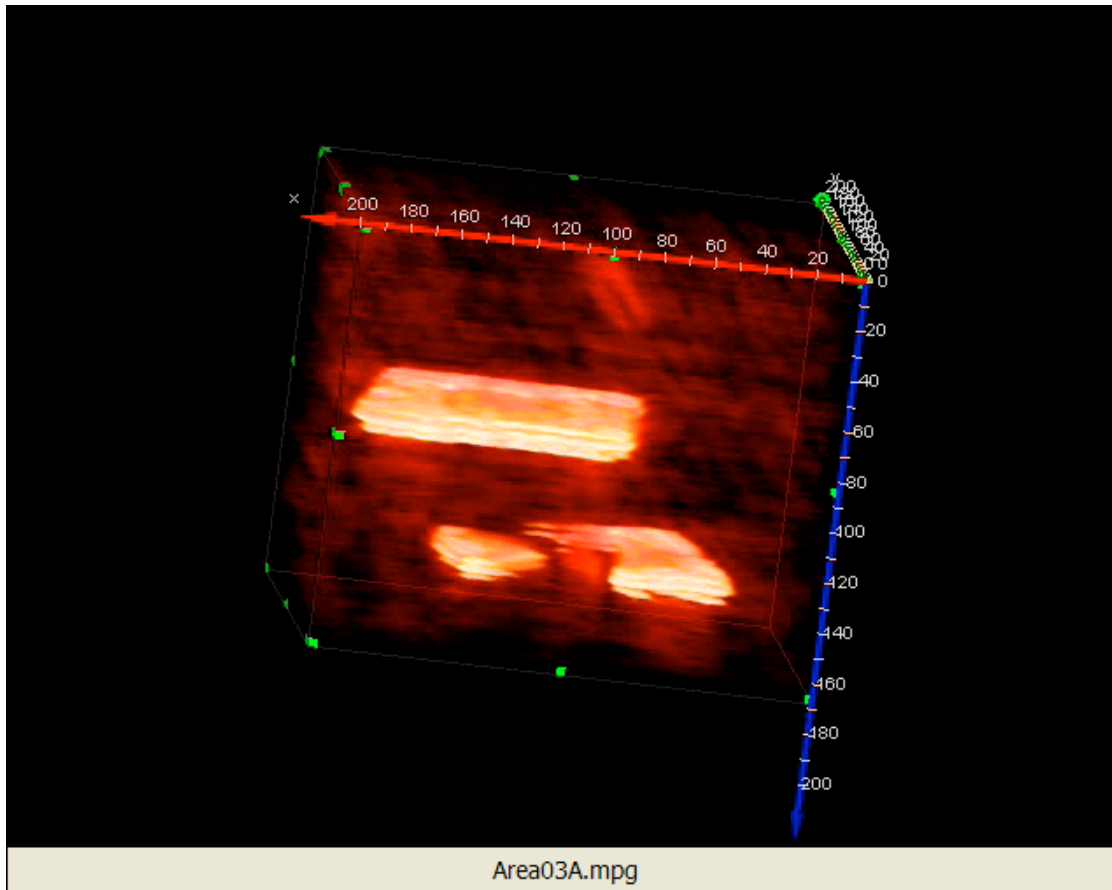

3D Volume
(Family of B-Scans)

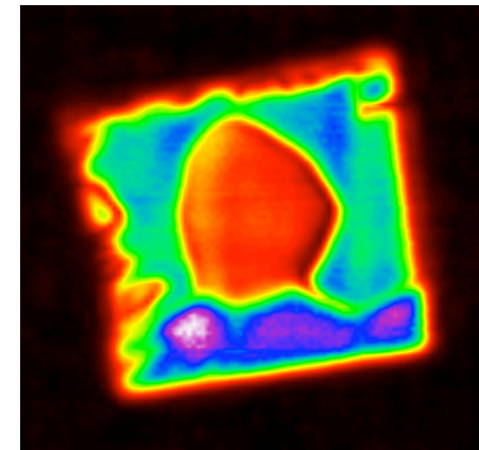

C-Scan
(Horizontal Slice
At Depth z : Use
A Time Gate)

Three Dimensional Rendering Helps Visualize the Locations of Defects/Flaws

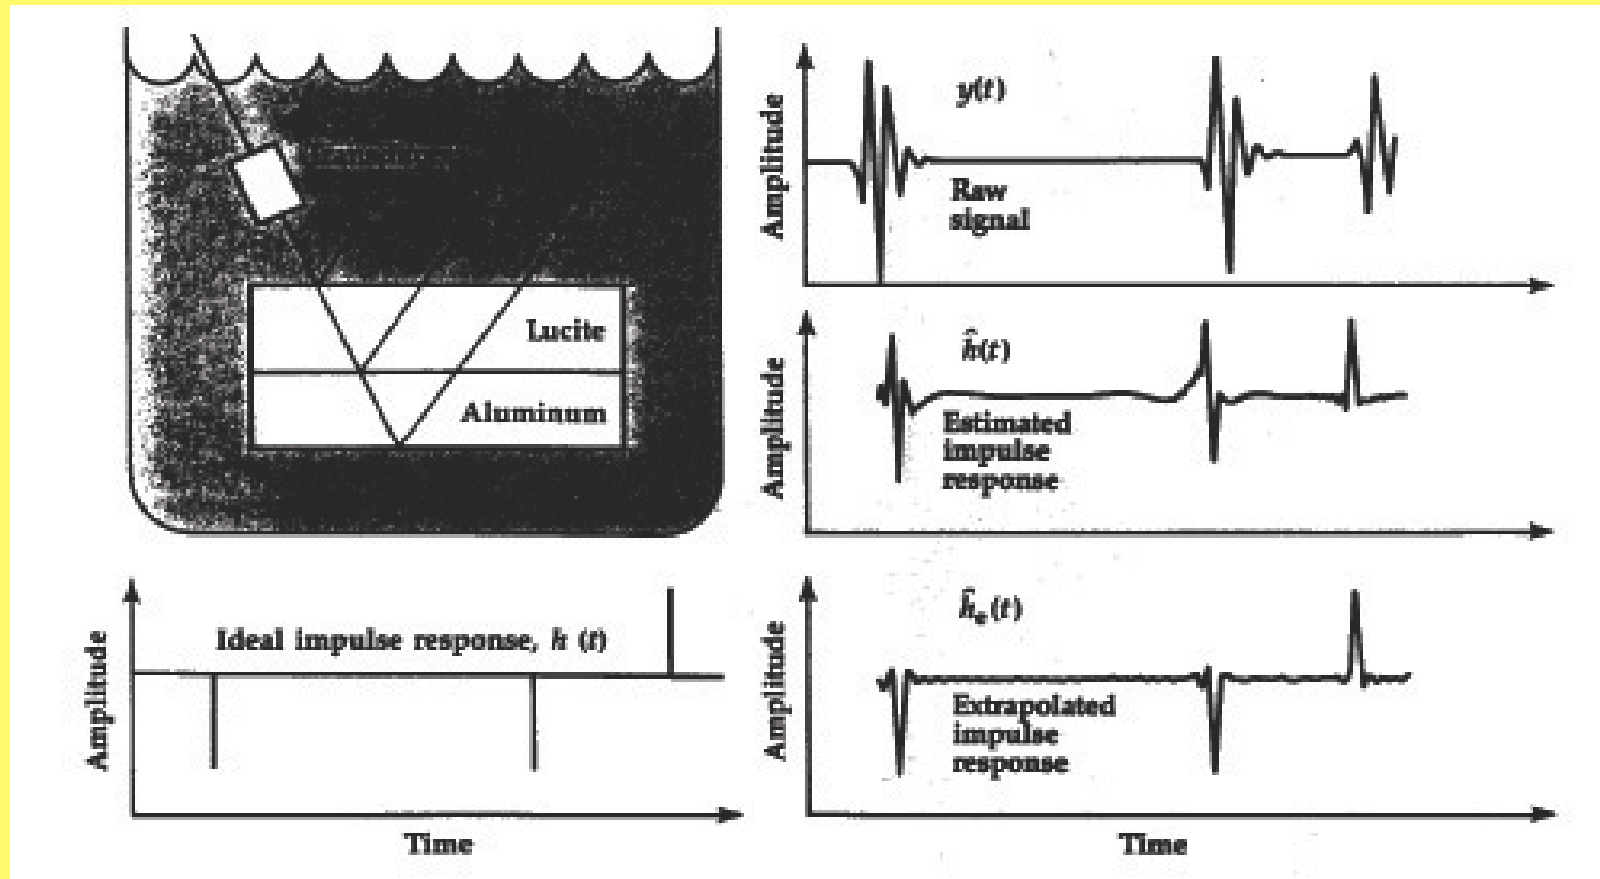

**3D Volume Rendered Image
(12mm Defect in Carbon Composite Test Plate)**

Original 2D C-Scan image

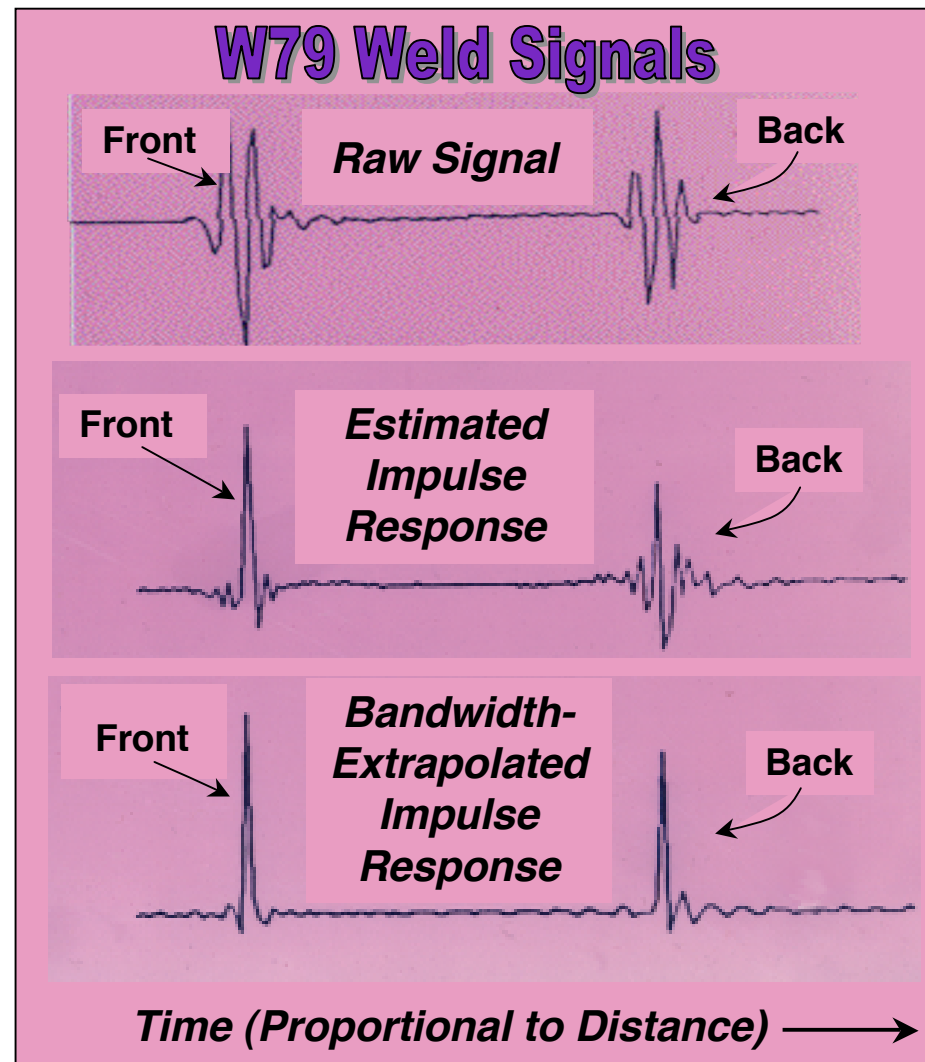

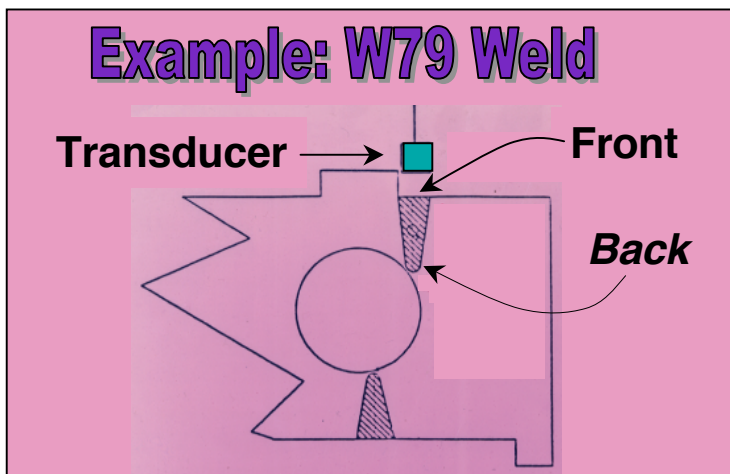

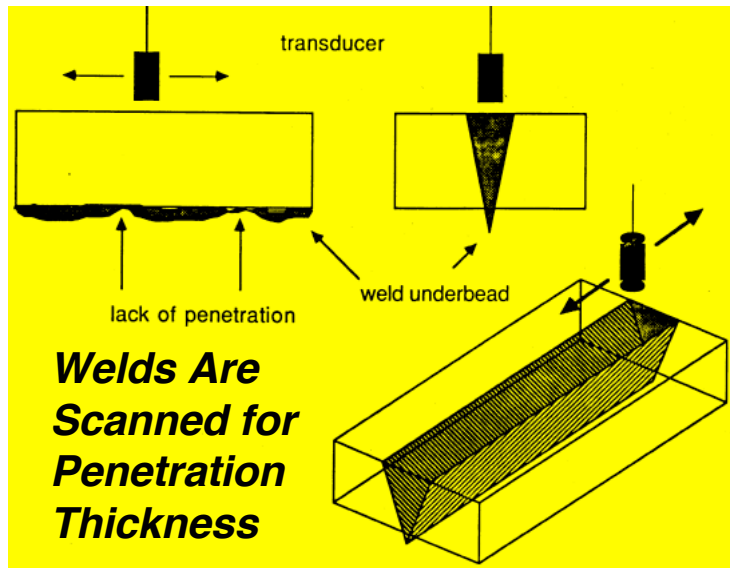

Ultrasonic Pulse-Echo Signals Are Distorted by the Transducer and the Propagation Paths

The Overall Measurement System Transfer Function: *When An Object is Present*

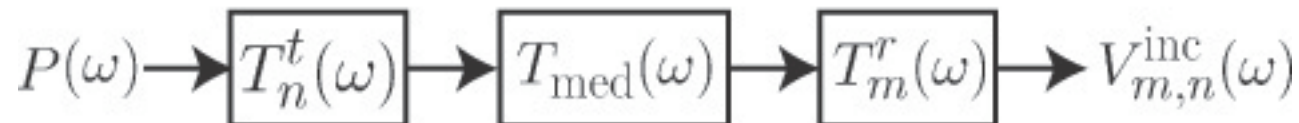

***The Object Measurement Contains Information
About the Transducers, the Propagation Paths,
AND the OBJECT of Interest***

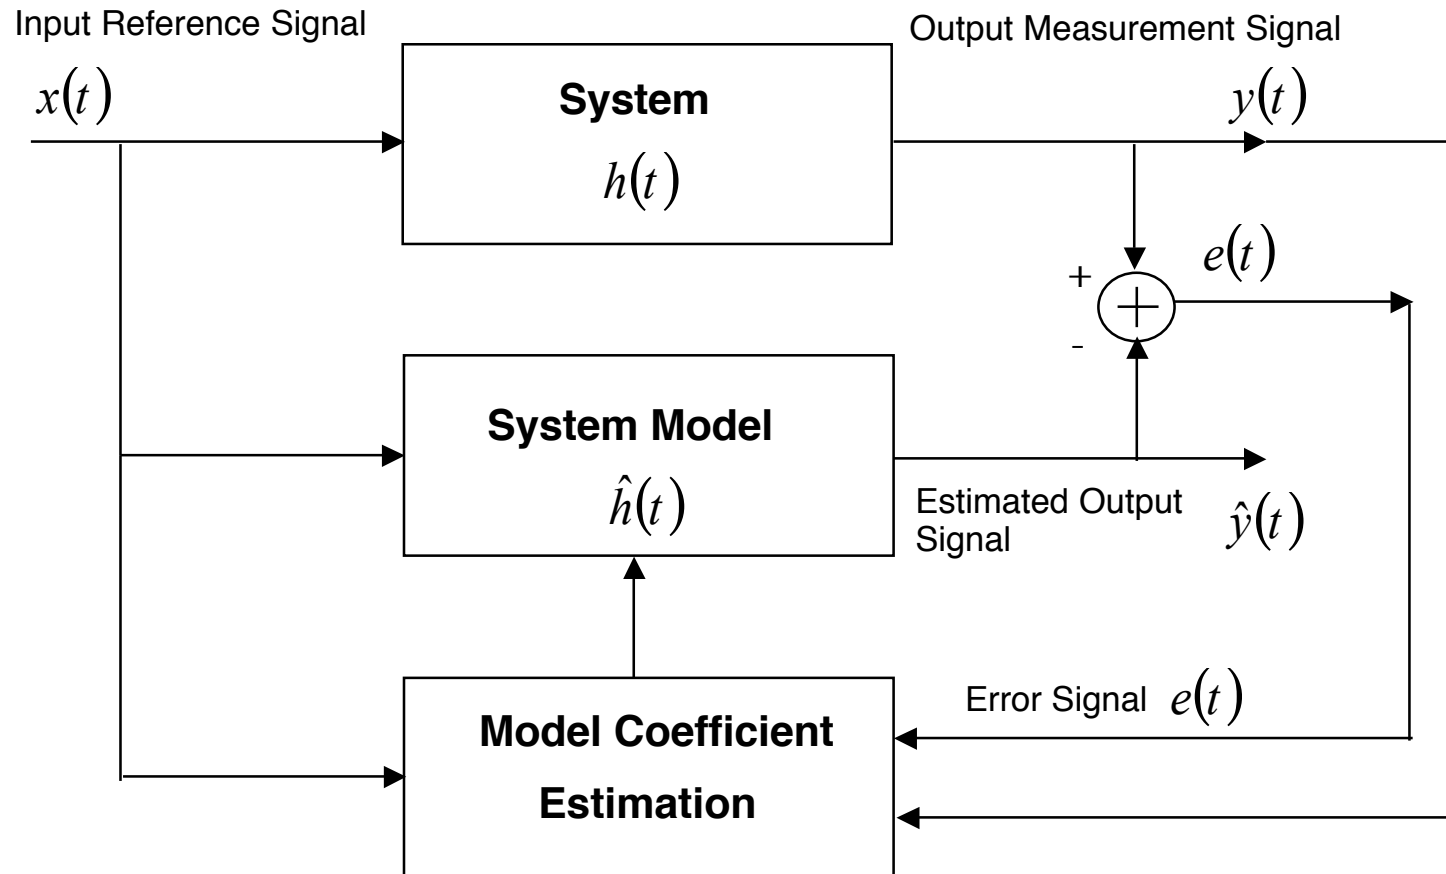

The Overall Measurement System Transfer Function:
When No Object is Present: Use This for a Reference!

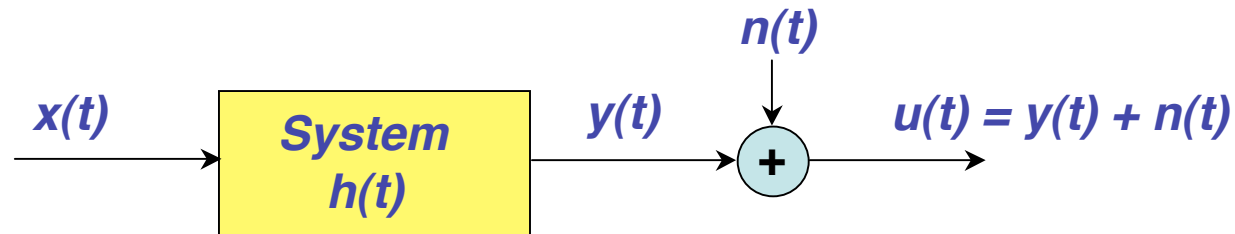

***The Reference Measurement Contains Information
About the Transducers and the Propagation Paths
(Example: Use a Front or Back Surface Reflection)***

System Identification: Given **Input $x(t)$** and **Output $y(t)$** , Estimate the System Impulse Response **$h(t)$**

The System Identification Problem (Inverse Problem) is *Ill-Posed*

System Identification:

Given: $x(t)$ and $u(t)$ \Rightarrow Find: $h(t)$

Deconvolution:

Given: $u(t)$ and $h(t)$ \Rightarrow Find: $x(t)$

NOISE: *Small perturbations in $u(t)$ map to large differences in the estimates of $h(t)$*

FINITE SUPPORT: *When $x(t)$ is frequency bandlimited, many operators $h(t)$ will produce the same output $u(t)$*

The Inverse Problem Is Very Difficult

We Must Regularize the Problem

- **Ill-Posed**
(Infinite Number
of possible
solutions)
- **Bandlimited
Transducer
Spectral
Response**
- **Ill-Conditioned -
Numerical Errors
Due to Spectral
Zeros**

Use a (Nonparametric) Finite Impulse Response (FIR) Model for the Discrete-Time Linear, Shift-Invariant System

$$\mathbf{u} = \mathbf{y} + \mathbf{n} \quad \mathbf{n} \text{ is Stationary WGN } \sim N[0, \sigma^2 I]$$

where $\mathbf{y} = \mathbf{X}\mathbf{h}$ (Convolution)

M = Number of Impulse Response Model Coefficients

N = Number of Input Samples in the Record

$$\begin{bmatrix} y(0) \\ y(1) \\ \vdots \\ y(N-1) \\ 0 \\ 0 \\ \vdots \\ 0 \end{bmatrix} = \begin{bmatrix} x(0) & 0 & 0 & 0 \\ x(1) & x(0) & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots \\ x(N-1) & x(N-2) & \cdots & x(0) \\ 0 & x(N-1) & x(1) & x(0) \\ \vdots & \vdots & \vdots & \vdots \\ 0 & 0 & x(N-1) & x(N-2) \\ 0 & 0 & 0 & x(N-1) \end{bmatrix} \begin{bmatrix} h(0) \\ h(1) \\ \vdots \\ h(M-1) \end{bmatrix}$$

$(M + N - 1 \times 1) \quad (M + N - 1) \times M \quad (M \times 1)$

Minimizing the Sum-Squared Error Subject to An **Energy Constraint** Gives the Estimate:

If we minimize the sum-squared error subject to the condition $\hat{\mathbf{h}}^T \mathbf{h} < C$, an energy constraint on $\hat{\mathbf{h}}$, then the form of the estimate is:

$$\hat{\mathbf{h}}(\alpha) = [\hat{\mathbf{R}}_{xx} + \alpha \mathbf{I}]^{-1} \hat{\mathbf{r}}_{xu}$$

Where:

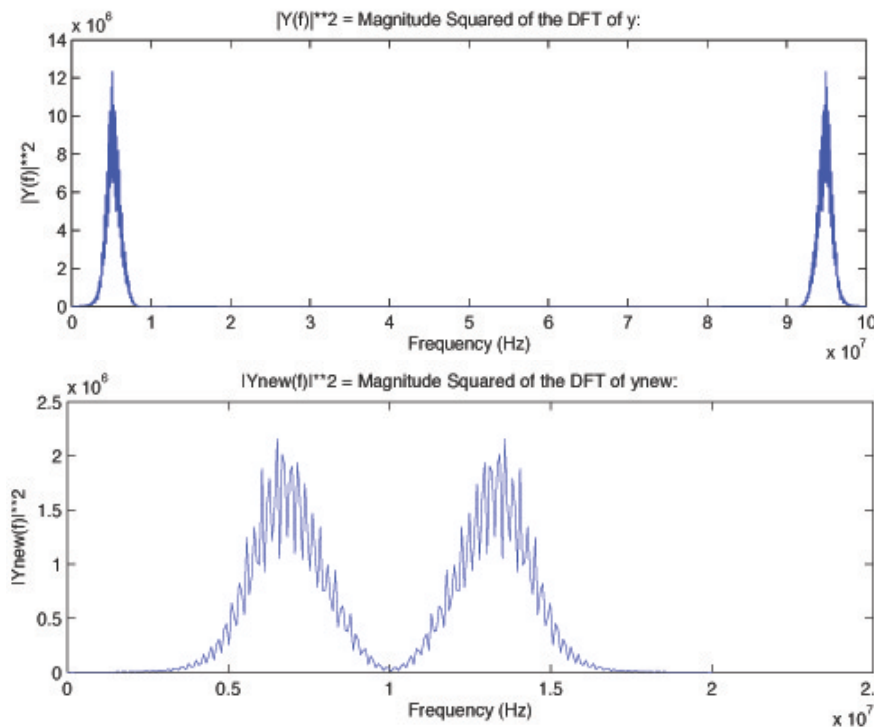

- α is a nonlinear, monotonically decreasing function of C and $\hat{\mathbf{h}}(\alpha)$
- $\hat{\mathbf{h}}(\alpha)$ is a **BIASED** estimate of \mathbf{h}
Biased in the sense that the Fourier transform of $\hat{\mathbf{h}}(\alpha)$ is forced To be small at frequencies where $\mathbf{x}(k)$ has little energy.

We Face a Bias vs. Variance Tradeoff!!

We *Preprocess* the Signals to Enforce Algorithmic Assumptions and to Minimize Artifacts in the Solution

- Ensemble average multiple signals to reduce noise variance.
- Remove means and trends (caused by instrumentation) to ensure linearity.
- Align signals temporally to ensure causality.
- Lowpass filter and decimate (down-sample) by a factor of M to remove spectral zeros (help improve the condition number of $\hat{\mathbf{R}}_{xx}$).

*Raw
Spectrum
(Oversampled)*

*Lowpass
Filtered and
Decimated
Spectrum
($M = 13/2$)*

The Workstation Provides a Central Location for Processing and Displaying 3-D Ultrasonic Data

**3-D Rendering
Computer**

**3-D Processing
Computer**

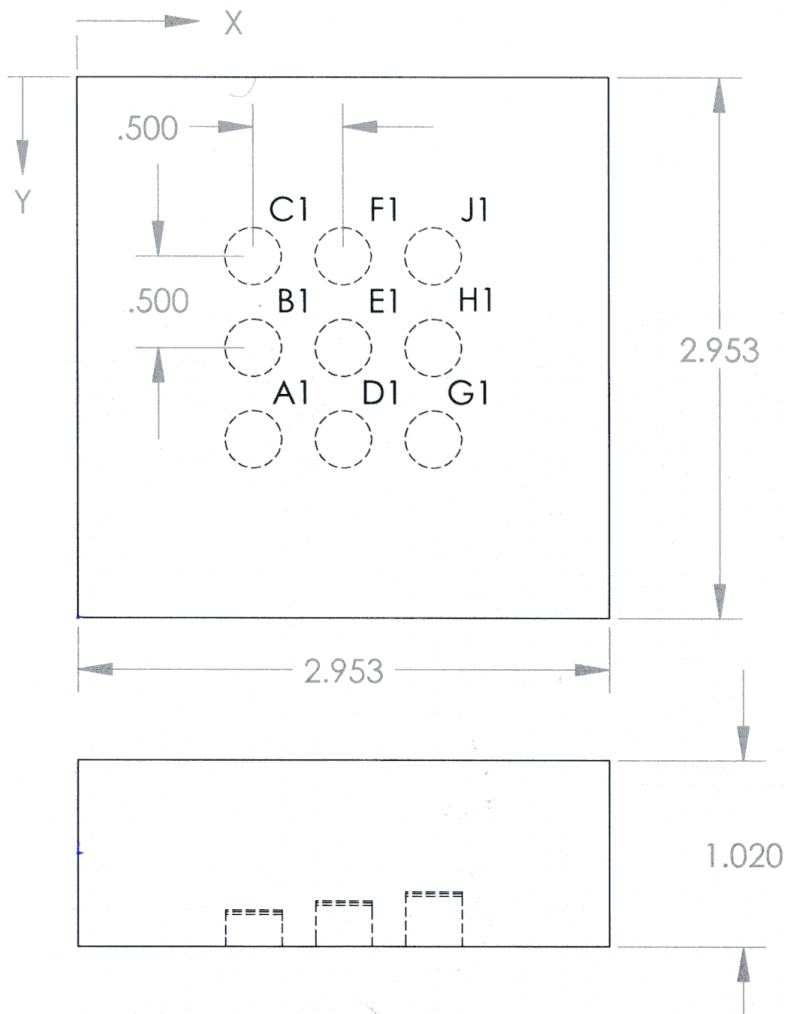

We Developed a User Interface Connecting NI-CVI and Matlab

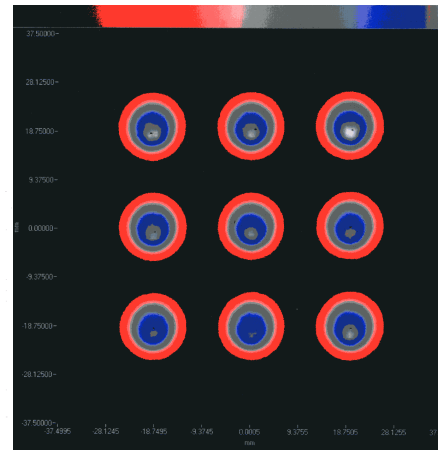

- **The Interactive user interface provides...**
 - **Support for multiple file formats**
 - **LLNL Acoustic Microscope**
 - **Panametrics Scanning Systems**
 - **Display of volume data**
 - **C-Scan, B-Scan, A-Scan**
 - **Interactive selection of input signal used for signal processing**
 - **Signal processing parameter setup**
 - **Linked to base volume file**
 - **Software connection between NI-CVI and MatLab**
 - **Display of processed volume data set**

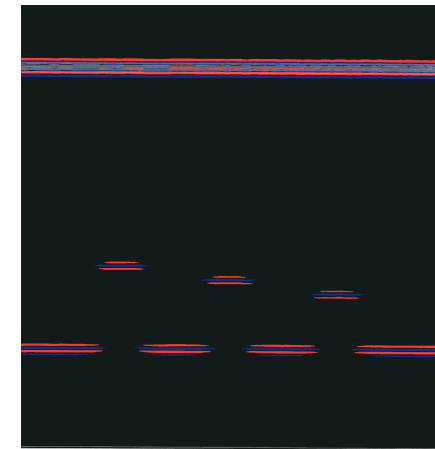

We Constructed a “Phantom” Part - *Aluminum Block* Containing *Flat-Bottom Holes*

C-Scan Image
(Horizontal Slice)

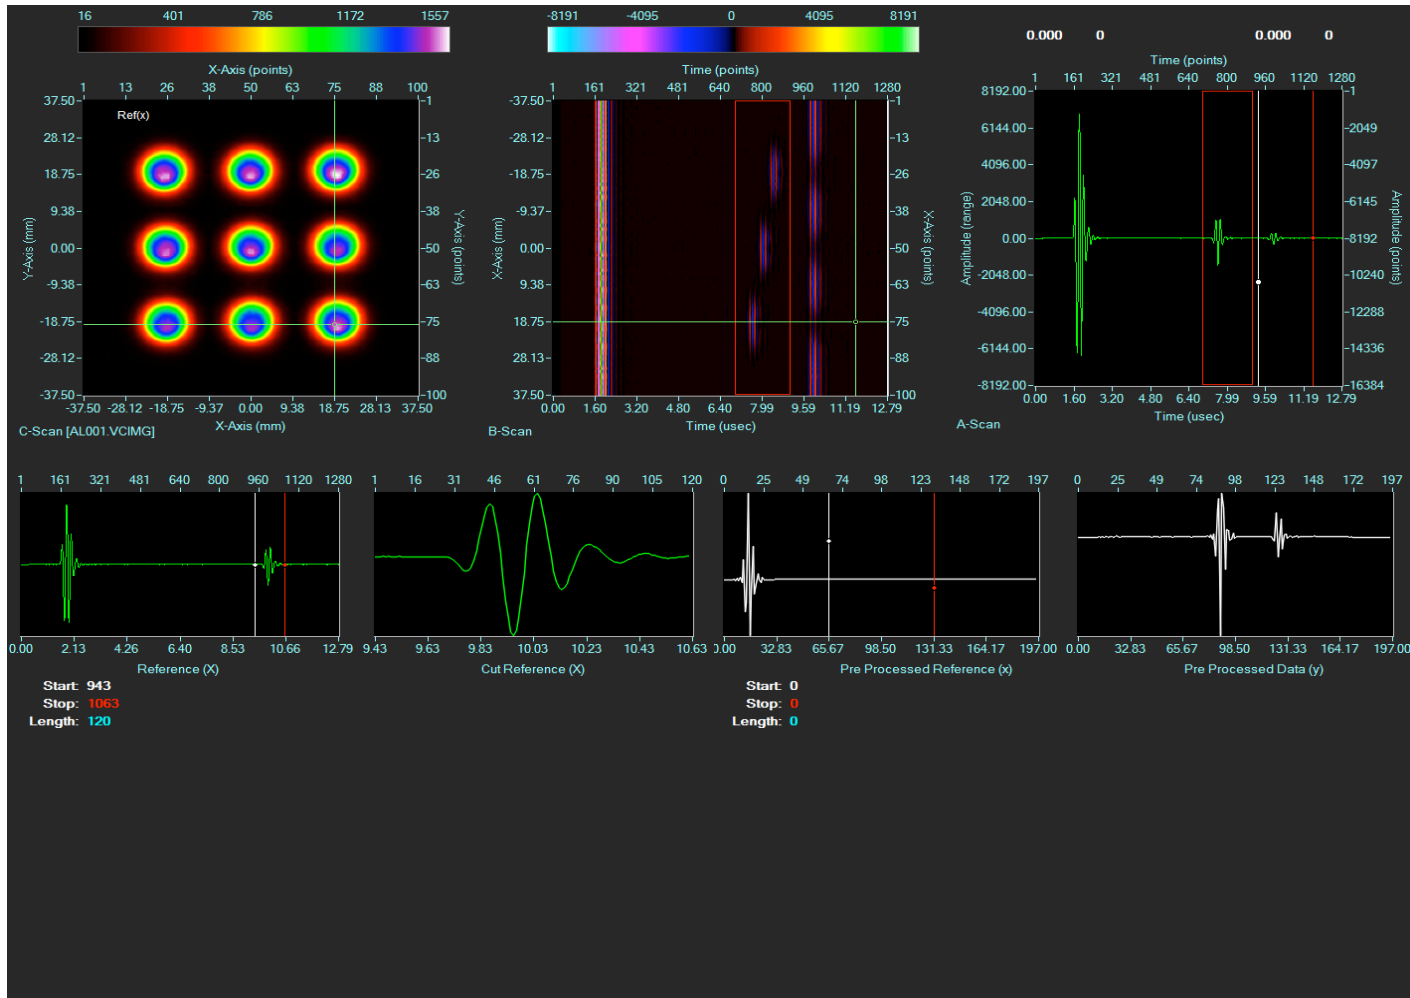

B-Scan Image
(Vertical Slice)

User Interface Provides a Visual Tool for Fine Tuning Algorithm Parameters and Processing

National Instruments CVI user interface linked to MATLAB

Measured Signals $x(t)$, $y(t)$ and $y(t-\delta)$

Reference Signal = **Front Reflection**

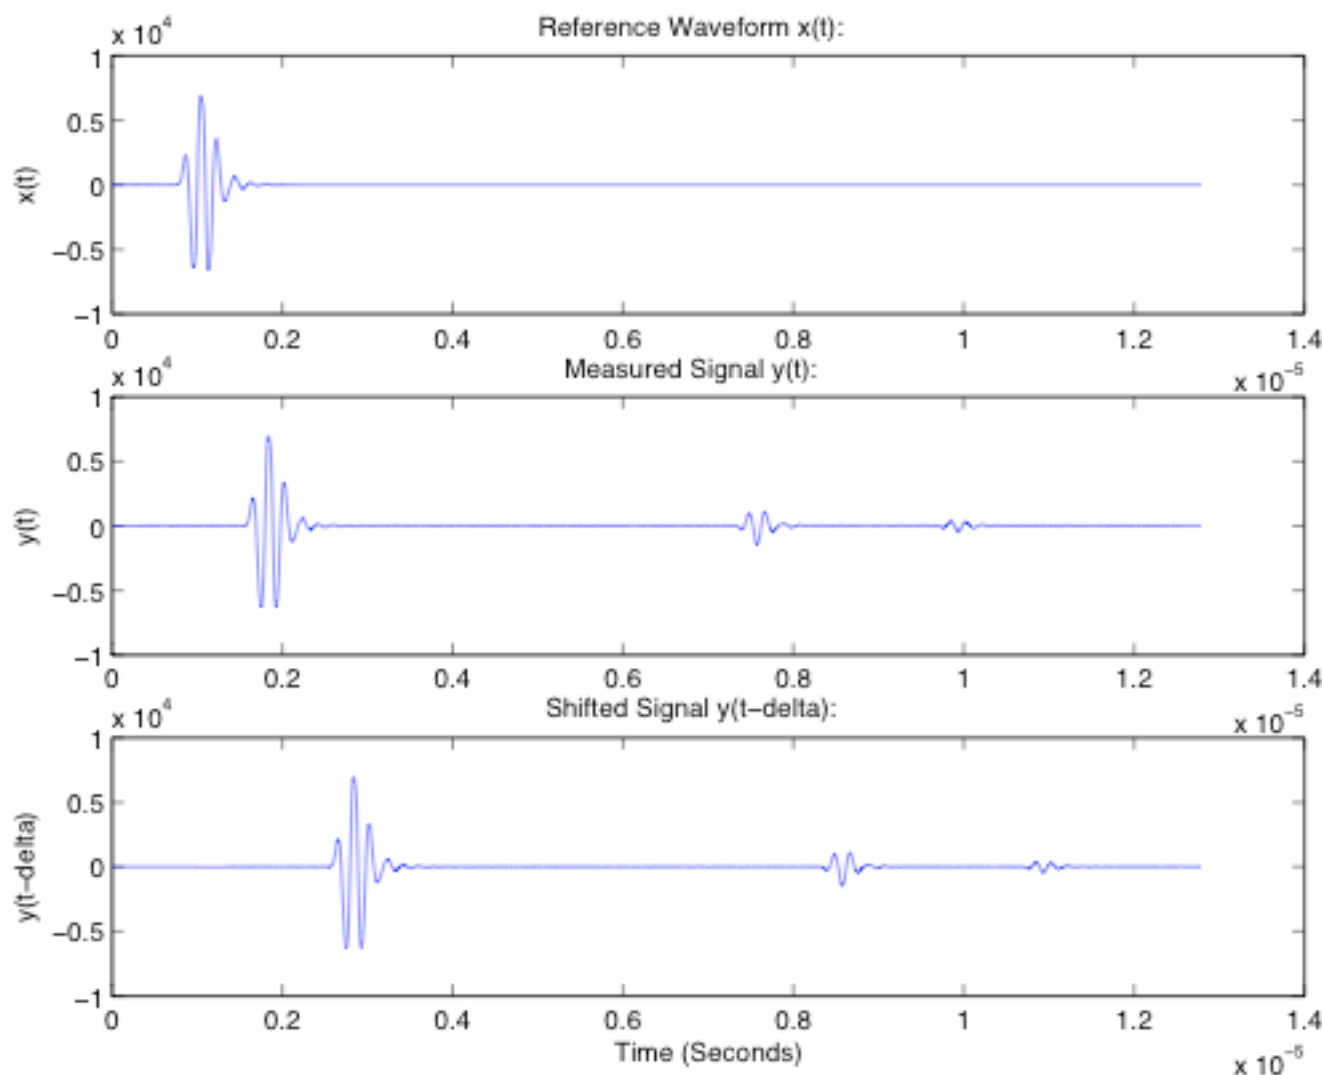

Figure 4.0.pdf: Estimated Impulse Response
Reference Signal = **Front Reflection**
We Are Primarily Interested in the *Hole Reflection*

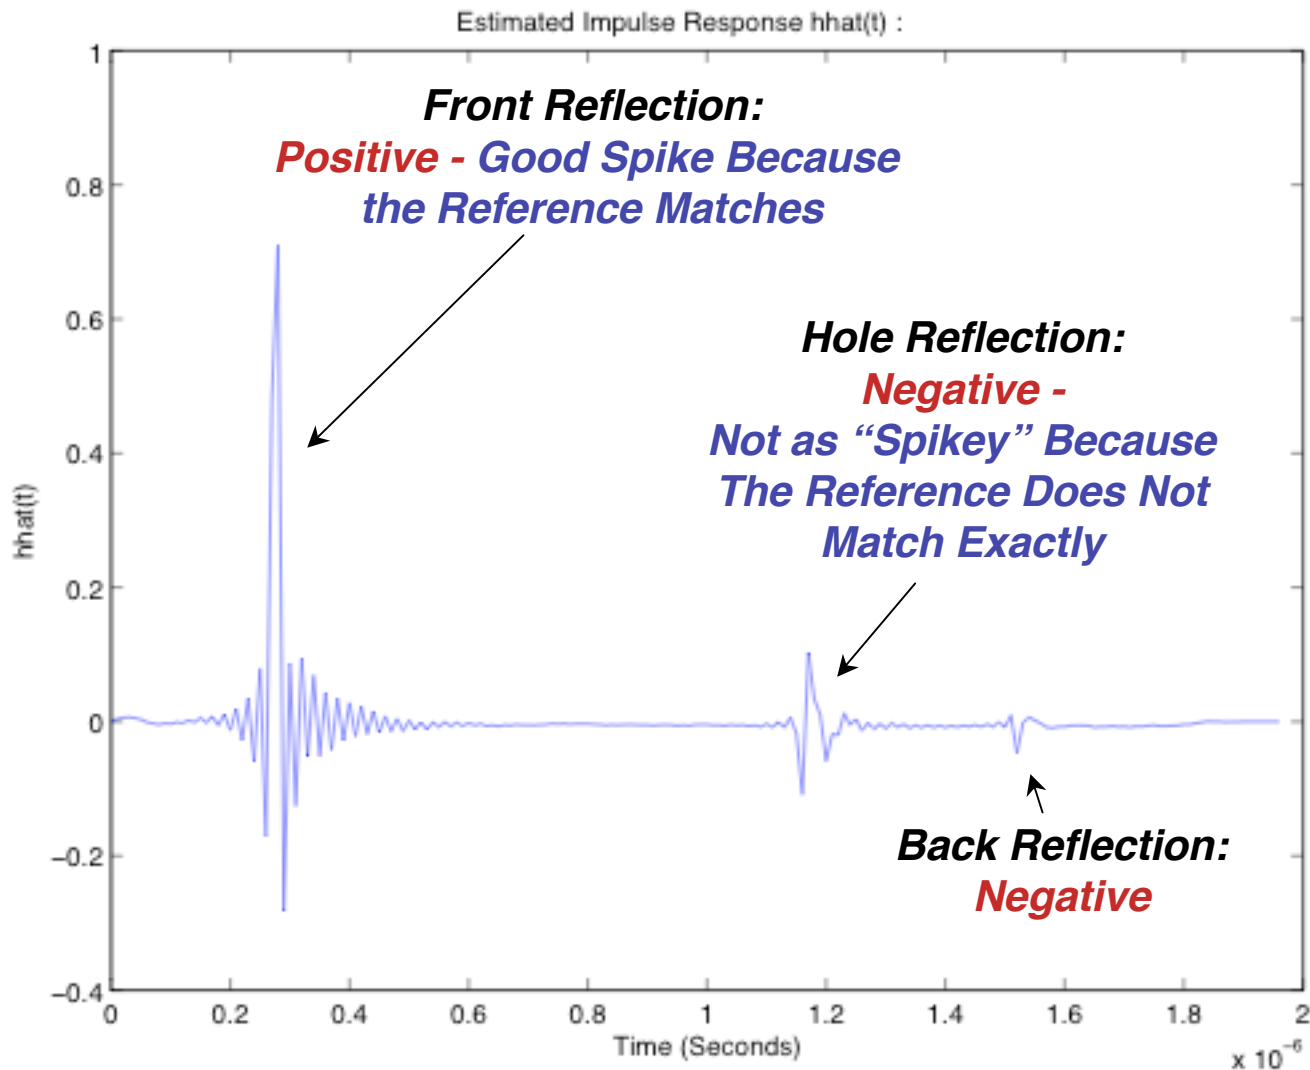

Figure 6.2.pdf: Measured Signals

Reference Signal = Back Wall Reflection

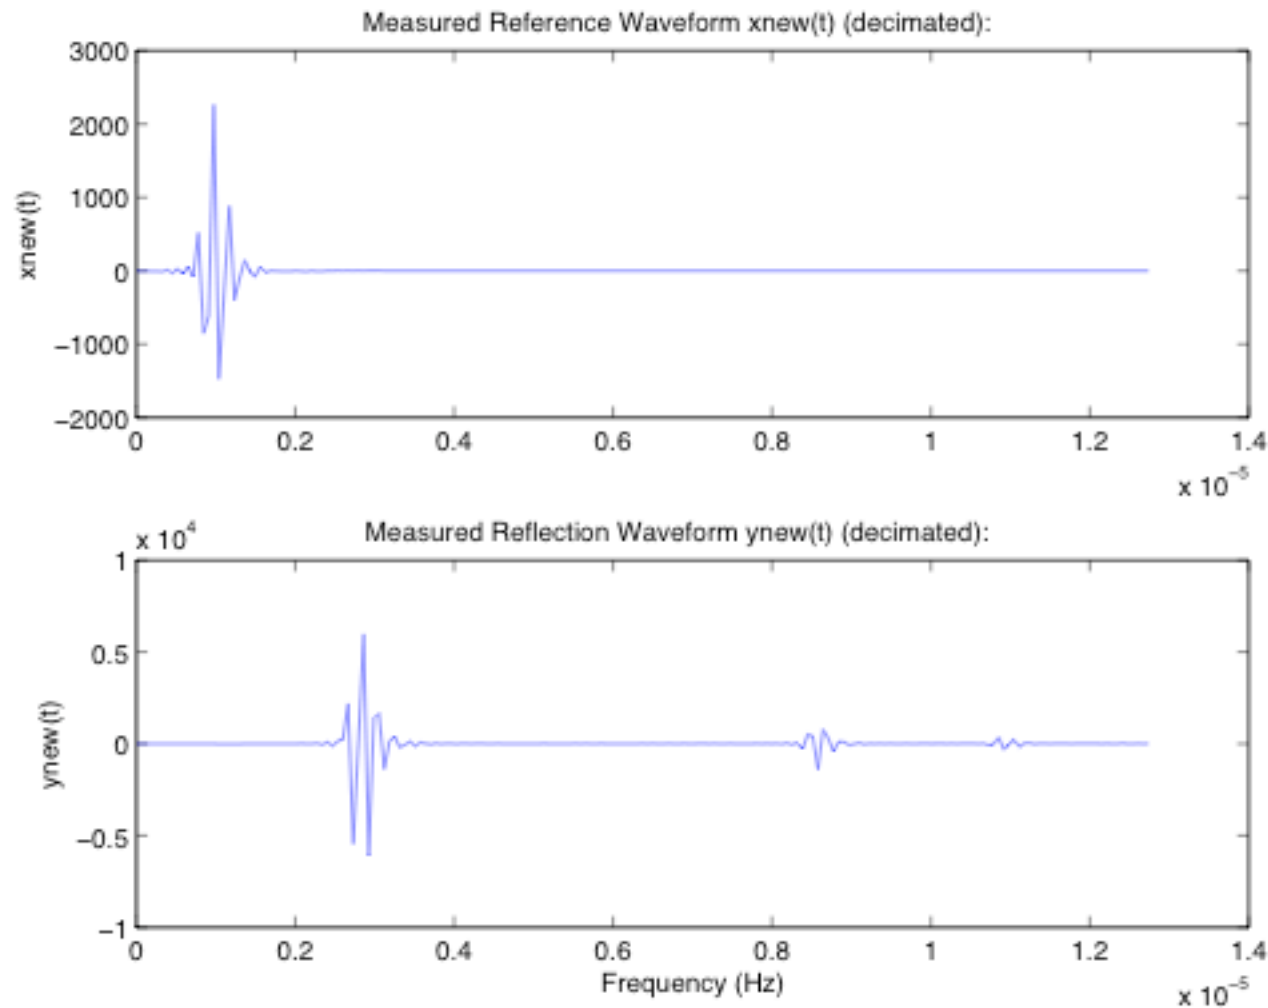

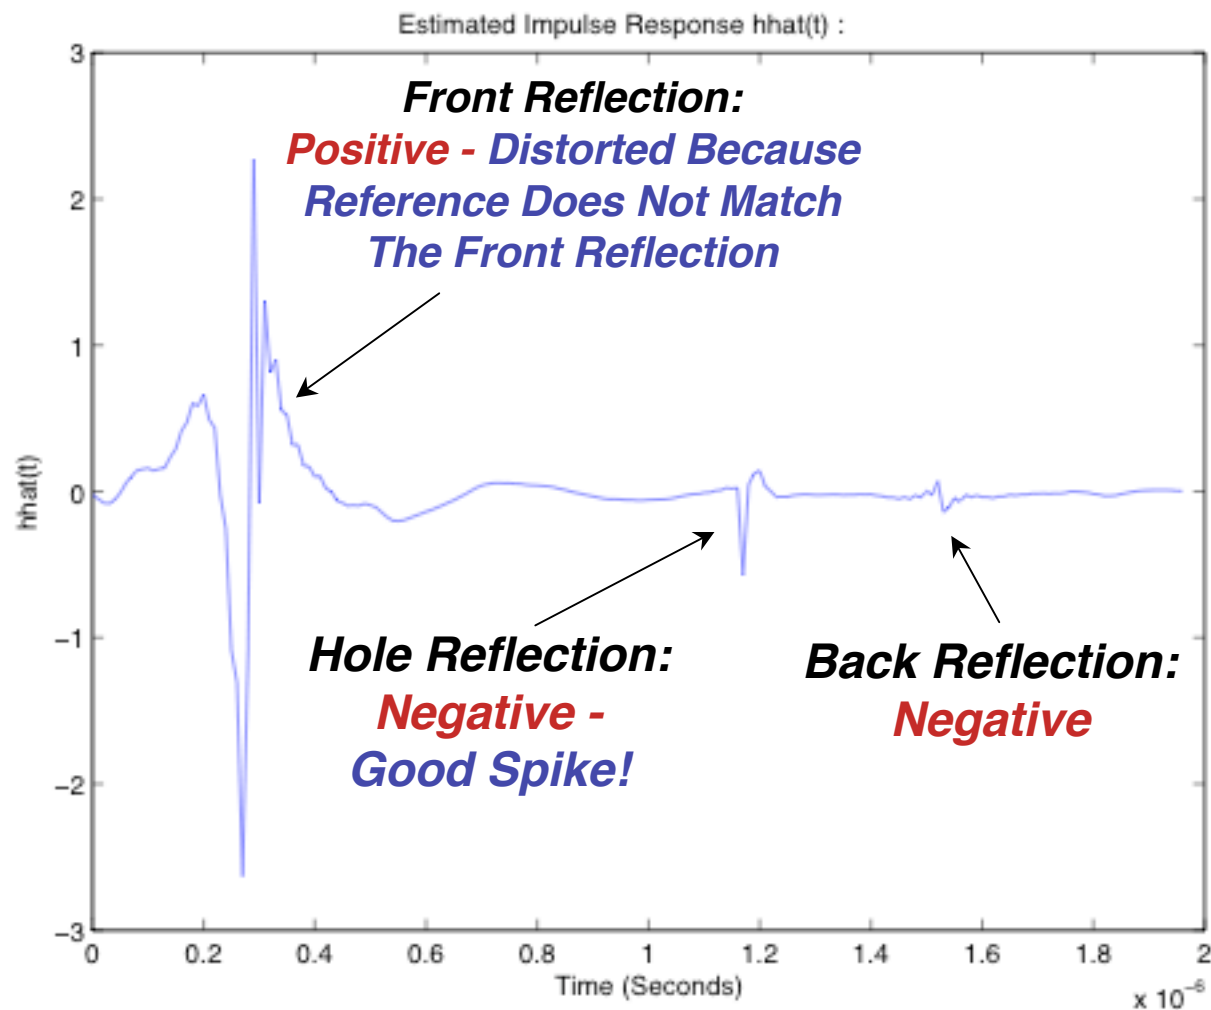

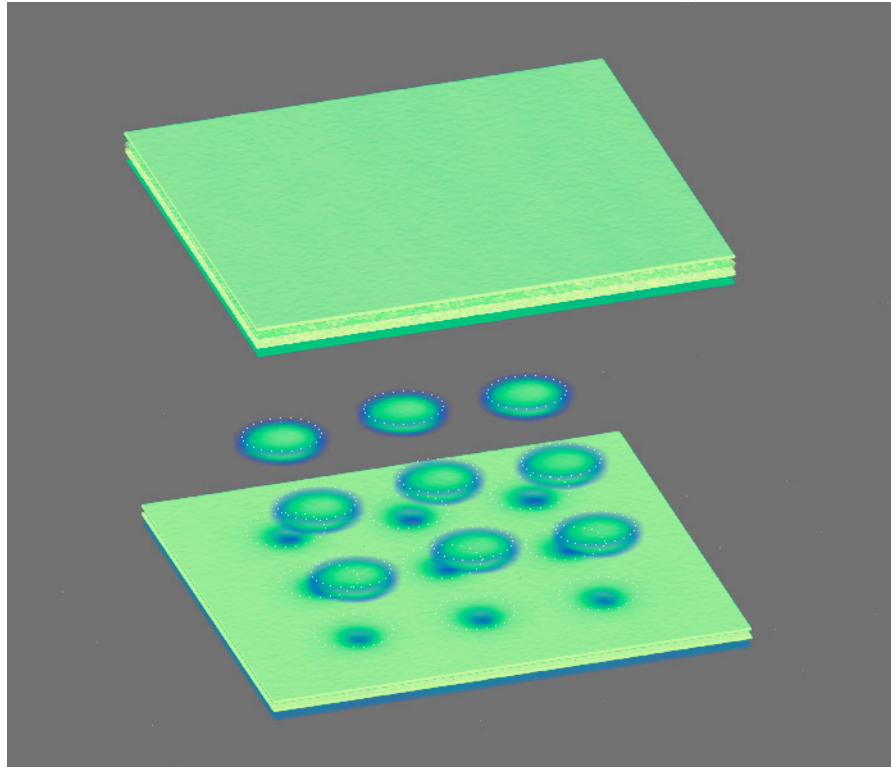

Figure 6.4.pdf: Estimated Impulse Response
Reference Signal = **Back Reflection**
We Are Primarily Interested in the *Hole Reflection*

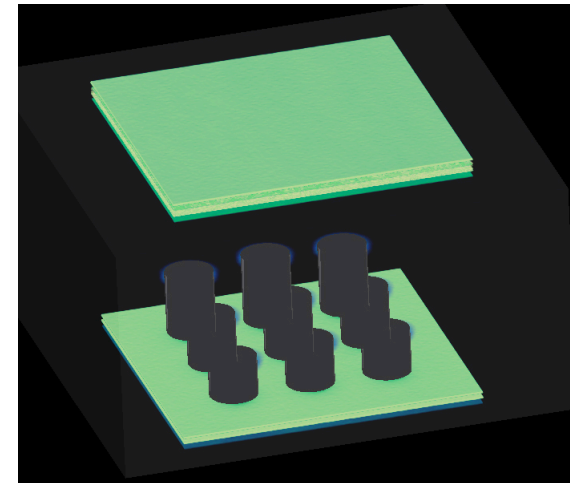

We Can Combine CAD Models With 3-D Data To Clarify Ultrasonic Evaluation Results

Grace A. Clark, Ph.D.

Future Work, Conclusions

- **We have in place:**
 - **Ultrasonic test bed**
 - **Workstation and interactive software dedicated to 3D ultrasonic image processing and rendering**
 - **We can combine CAD drawings with rendered data for image analysis/comparison**
 - **System Identification algorithms/software for enhancing spatial resolution**

- **Future Work**
 - **Techbase project for super-resolution algorithm implementation (research is complete)**
 - **Integrate the super-resolution algorithm with the workstation system**
 - **Applications to programmatic data sets**
